

Medication Management Program

- Falls are the #1 cause of injuries and deaths from injury among older Americans
- Medications can increase a senior's risk of falling
- 73% of hospital admissions of patients older than 65 years are due to falls.
- 75% of Americans have trouble taking their medicine as directed.

The RN Health Medication Management Program is a personalized service designed to help clients manage their medications safely, effectively, and as medically prescribed, thus reducing fall risk.

Our nurses reconcile medication orders and communicate with prescribers and pharmacies to manage medication type, dosage, interactions, and side effects. Our nurses are also available between visits, to respond to medication-related questions or concerns.

Client Benefits

- **Adherence:** Helps to ensure medication is taken exactly as prescribed and instructed
- **Advocacy:** Nurse oversight, personalization, and medication minimization when possible and appropriate
- **Discrepancy Avoidance:** Identification of medication discrepancies between prescribers
- **Cognitive Capacity:** Additional oversight in the event of a client's diminishing cognitive capacity
- **Cost Reductions:** Recommendations of cost-effective options for medication purchases and delivery options
- **Education:** Ongoing Client and caregiver-focused medication and dispensing education and support
- **Hospitalization Mitigation:** Supports reduction in ER visits and hospital admissions due to adverse medication events such as falls
